People think scrolling on TikTok will help with their boredom, but it actually causes boredom and takes away time from exploring options that will get rid of boredom. In this article [“Scientists say mindless scrolling through online videos makes boredom worse” by Carolyn Y. Johnson, The Washington Post](#), it states that “People who are bored often turn to their phones, but then report being more bored, some studies have found.” This quote is interesting because it states people who are on their phones are likely to be on their phone to get rid of boredom. These people believe that TikTok is the only way to get rid of boredom, and with the popularity of TikTok, many use the app because it's funny but don't realize it can be causing boredom. TikTok is taking away their time, especially in kids that are missing out on their childhood without social media. The article also states that, “When you’re immersed, you don’t feel bored. When your attention is spread, you’re almost by definition not satisfied.” The explanation of this quote is that when your focused, you don't feel bored, like when watching a movie, but when you're not focused and have the option to scroll between videos, you feel bored because you're never really focused. Everyone has a different algorithm on TikTok, which depends on the videos they have liked, but many will scroll until they find a video they like or previously liked, and will feel bored when they find a video they don't like. In conclusion, people spend time scrolling on TikTok believing it gets rid of their boredom, but it just takes away their time by mindlessly scrolling and possibly causing more boredom when they can find other, less time-wasting ways to get rid of boredom.
