

Scenario: City Transportation Plan

ISSUE JANUARY

NEWS

Budget: \$5 million

“A city must improve transportation while reducing traffic and pollution.”

Goal: Balance convenience and environment impact

Options:

- Expand public bus routes - 3M
- Bike Lanes & Pedestrian Safety - \$2M
- Road repairs & Maintenance - \$2.5M
- Traffic Technology (smart lights) - \$1.5M
- Subsidies for electric vehicles - \$2M

Trade-Offs

Expand Public Bus Routes - \$3M, Making more bus routes and helping improve transportation for more people to get around and reducing pollution.

Subsidies for Electric Vehicles - \$2M, This helps people buy eco-friendly cars and reduces pollution by encouraging less gas usage.

Opportunity Cost:

Bike Lanes & Pedestrian Safety - \$2M, losing safer streets for bikers and pedestrians as well as fewer traffic accidents.

Road Repairs & Maintenance - \$2.5M, losing smoother, safer roads, fewer potholes and car damage.

Traffic Technology (Smart Lights) - \$1.5M, traffic moves slower, there will be more jams, travel time will take longer.

This trade-off matters because the city can't fund everything, so choosing buses and electric vehicles means giving up other improvements to reduce traffic and pollution. The city will make long-term progress toward cleaner air and less gas usage while improving public transportation.

Scenario: City Transportation Plan

Priscila Pedro

Budget: \$5 million

A city must improve transportation while reducing traffic and pollution.

Options:

- Expand public bus routes- \$3M
- Bike Lanes & Pedestrian Safety - \$2M
- Road repairs & Maintenance - \$2.5M
- Traffic Technology (smart lights) - \$1.5M
- Subsidies for electric vehicles - \$2M

Goal: Balance convenience, equity, and environment impact.

- Although **road repairs, smart traffic lights, and electric vehicle subsidies** were appealing, we chose to expand **public bus routes and invest in bike lanes and pedestrian safety**. Buses carry more people, which reduces traffic and pollution, and they help students, elderly people, and low-income families who may not have cars. Bike lanes and safer sidewalks also protect pedestrians and cyclists.
- The opportunity cost was choosing **road repairs, smart traffic lights, or electric vehicle subsidies** since they were the best alternatives we gave up.
- This trade-off matters because the city can't fund everything, so choosing buses and bike lanes means giving up other improvements to reduce traffic and pollution and promote equity.

Scenario: City Transportation Plan Carolina Raudales

budget:\$5 million

A city must improve transportation while reducing traffic and pollution

Options:

- Expand public bus routes- 3M
- Bike Lanes & Pedestrian Safety - \$2M
- Road repairs & Maintenance -\$2.5M
- Traffic Technology (smart lights) -\$1.5M
- Subsidies for electric vehicles -\$2M

Goal:Balance convenience,equity and environment impact

Expand Public Bus Routes – \$3M

- More routes and increased bus usage for the public
- Offers affordable ways for people to get around the city
- Reduces traffic congestion and air pollution

Subsidies for Electric Vehicles – \$2M

- Encourages residents to switch from gas cars to Electric vehicles
- Lowers carbon emissions and improves air quality
- Helps keep transportation eco-friendly and sustainable for the future

Although **bike lanes and pedestrian safety** improvements were appealing, we chose to invest in **expanding public bus routes and electric vehicle subsidies** because **they reduce pollution while improving transportation access for more people.**

The opportunity cost was **bike lanes and pedestrian safety, road repairs & maintenance, and smart lights** since it was the best alternatives we lost.

This trade-off matters because while fewer people immediately benefit from electric vehicle subsidies, the city still makes long-term progress toward cleaner air and less gas usage.
